

Do you have one of these vision problems?

Lazy-Eye Strabismus Anisometropia

Scientists and eye physicians at The Smith-Kettlewell Eye Research Institute in San Francisco are studying visual development in adults. People with amblyopia (sometimes referred to as “lazy eye”), people with strabismus (misaligned eyes) and people with anisometropia (unequal refractive power) may be eligible to participate in the study. Currently we are seeking adults between the ages of 18 and 65 years old.

Participation is totally voluntary and involves measuring eye movements and the ability to see certain visual targets displayed on a computer monitor. Other testing may include placing sensors on the back of the head (Visual Evoked Potential) to measure the brain’s response to visual targets on the computer. These tests are not invasive. We pay research participants \$20.00 per hour to compensate for their time.

**To participate or for more information,
please contact Margaret McGovern at (415)345-2075.**
