

Do you have one of these vision problems?

Lazy-Eye Strabismus Anisometropia

Scientists and eye physicians at The Smith-Kettlewell Eye Research Institute in San Francisco are studying vision impairment in adults. People with amblyopia, sometimes referred to as “lazy eye,” and people with strabismus (misaligned eyes) may be eligible to participate in the study. Currently we are seeking adults between the ages of 18 and 70 years old.

Testing involves measuring visual function by pressing a button when observing various patterns on computer screen, or wearing a stretchy cap so that the signals from the brain can be recorded when observing the patterns. These tests are not invasive. A session is typically a couple of hours, with the possibility of having an ongoing enrollment. We pay research participants \$20.00 per hour to help compensate for your time and travel-related expenses.

**To participate or for more information,
please contact Chuan Hou, MD, PhD.**
